.Q: Chain two bluetooth apps together I've written a bluetooth app using Python. The core functionality is fairly simple, but it gets quite a bit more complex when it comes to interactions with other apps. In some cases the only way to get the data I need is to call the other app and feed it the data. In others, I need to call the other app and get the data it generates and use it to modify the data I get from the first app. In other cases, the data is already generated by another app. Is there a way to "chain" two apps together so that they all get triggered on something? What I'd really like to do is to be able to generate this data and pass it off to some other app and have that app do something with it. Can I do that? Is it possible? Is there a more direct way to do what I'm trying to do? Thanks! A: Yes, you can chain bluetooth applications. If the application has a message transport layer, you can send the data to the remote application and get a response back. A: The easiest way to do this is to use the BluetoothSocket module in Python. When you send a write command to the socket (called SEND), the data you write to the socket will be passed to the receiving application. To send data to the remote device, use the following code: import bluetooth remote\_socket = bluetooth.BluetoothSocket(bluetooth.RFCOMM) remote\_socket.connect(("10.0.0.222", 1)) # the IP and port numbers have to be correct remote\_socket.write(b"Hello, World!") remote\_socket.close() To receive the data, you can use the following code: import bluetooth remote\_socket = bluetooth.BluetoothSocket(bluetooth.RFCOMM) remote\_socket.connect(("10.0.0.222", 1)) remote\_socket.recv(1024) remote\_socket.close() The BluetoothSocket module has many other functions that are worth exploring. Q: How to make a set of linked list nodes have same data I have two classes. Student - Class holding details of a student. Test - Class holding details of a test. 82138339de
