History The first version of AutoCAD was released by Knowledge Systems in 1983 for the Macintosh. AutoCAD was designed to fill a gap in that there was then no other computer-based drafting software. When the Macintosh project was completed, it took on the role of CAD software on other platforms such as IBM PC-based systems, first in 1984, the popular Apple II. The release of AutoCAD 2.0 in 1989 expanded to other platforms and the Mac and in 1989 AutoCAD was ported to DOS. The standard time management system of DOS was replaced by the Windows environment. The VDWorks Modeling System, a supercomputer, produced AutoCAD's use as a multi-user, remote-access CAD application. In the early 1980s, there were no AutoCAD, DWG or DGN format standards. With that, a problem appeared for users and vendors. In the early days, AutoCAD was an expensive proprietary program, but it used a file format called an extended drawing. The format was well supported on the Macintosh platform but not on PCs at the time. In 1985, the format was revised and renamed DGN. The new file format was supported on all platforms and applications at the time. The new format also supported the ability to save as DXF in the native file format on Windows platforms. AutoCAD was originally developed by Knowledge Systems and was originally called GAS and was rewritten from scratch. By 1990, Knowledge Systems' sales had fallen from \$46 million in 1988 to \$19 million. The company filed for bankruptcy in 1991. From 1991 to 2002, AutoCAD was marketed as a product of the then-IBM subsidiary Corel, which acquired the rights to the software in 1991. In 2003, Accellera, a member of the Open Group, released the first open-source CAD model standards. One of these standards, based on the DGN and DXF formats, is ObjectARX. Accellera and AutoCAD subsequently released a shared revision of the ObjectARX specification. AutoCAD Architecture, an object-oriented programming extension to AutoCAD, was released in 2004. In 2005, the release of the ObjectARX V4 standard for AutoCAD extended ObjectARX to accommodate the DXF graphics file. The first year after the release of open-source AutoCAD, the number of AutoCAD users increased by about 2.5% to 6 a1d647c40b

Como seria a maneira correta de preencher os valores numa query? A mesma não faz sentido (como eu fiz), pois até aqui todos os objetos na query já estão preenchidos com os valores em atributos do objeto, então a solução é ótima até o momento, mas eu queria saber se existe uma maneira mais adequada de fazer isso. Já testei a seguinte: em um método criar uma query usando o JPA, porém, o valor que está passando é o objeto, o que não é possível porque o atributo do objeto não é conhecido:

```
public List listar(DadosNova dadosNova) { List resultado = getDao().findByDadosNova(dadosNova); return resultado; }
```

 Para o atributo, a forma é conhecida pelo atributo, mas, mesmo assim, pode utilizar um objeto de uma classe intermediária que possua os atribut
