Non-native stem The term non-native stem (also referred to as a non-native offshoot) is used to refer to a variant of a native plant that

differs from its wild or ancestral form. This might be due to genetic factors or environmental factors, such as cultivation. Non-native stems may be classified as true hybrids or natural hybrids, natural variants, or cultivars. True hybrids are formed by sexual recombination of genetically distinct individuals, whereas natural hybrids occur by vegetative propagation, e.g. cuttings or seedlings. Non-native stems that differ from the wild form are natural variants, which are not actually the progeny of a cross between wild and cultivated parents. Finally, some non-native stems may have been created through artificial selection. A taxonomic hierarchy of classification systems exists, whereby some species are classified as a single species, and some are classified into more than one species, using the following hierarchies: order, family, genus, species, and variety. Some non-native stems may
